Tech giant Meta has unveiled a new set of AI-powered smart glasses with an in-lens display to check messages, preview photos, see translations, add captions for conversations in noisy environments and call up music.

The Meta Ray-Ban Display spectacles come with Meta Neural Band, a wristband that translates the signals created by your muscle activity into commands for your glasses.

The US company said It's technology that keeps users tuned in to the world around them, not distracted from it.

The AI glasses come with a full-colour, high-resolution display when required so can be turned on and off.

The display is placed off to the side, so it doesn't obstruct your view.

Meta, owners of Facebook, claims it is the first product that takes microphones, speakers, cameras, and a full-colour display backed with AI in a single device.

The Meta Neural Band replaces touchscreens buttons and dials with a sensor that can scroll, click, and, in the near future, even write out messages using subtle finger movements.

A spokesman said the wristband enables intuitive control using subtle hand movements, without having to touch the glasses or take out a phone.
