A new device is claimed to prevent the underarm body odour without the use of deodorant, by killing the bacteria that use it,

The gadget, called the PlaDeo was invented by two South Korean doctors

The user holds it beneath each clean, dry armpit in turn.

Pressing and holding the power button for 90 seconds causes the PlaDeo to start producing a gas called cold atmospheric plasma.

The gas generates reactive oxygen and nitrogen, a group of chemically reactive molecules that kill bacteria.

A 1 cm gap between the device's plasma emitter and the armpit means skin cells are not harmed.

The process reportedly allows an armpit to remain odour-free for a day.

There is no pore-clogging or sticky residue found with may spray or roll-on deodorants.

OPS: The PlaDeo deodoriser device
