Caption

May 11, 2018 - Hawaii, U.S. - At 9:17 a.m. HST, another weak ash plume rose from the Overlook Vent in Halema'uma'u crater, producing a slightly more energetic and darker plume. This second plume lacked the pink altered ash that was in the earlier plume, apparently consisting of more unaltered (therefore darker) rock fragments. This plume also was probably caused by rockfall into the deepening vent, not related to groundwater and steam-driven explosions. Some 18 fissures have now opened up as a result of the volcanic eruption, with the latest fracturing on the Kalapana side of Highway 132. It is already spewing steam and lava spatter activity (FOTO: DUKAS/ZUMA)
